-!- CATALYTIC ACTIVITY: Phosphatidyl-L.serine =
phosphatidylethanolamine + CO(2).
-!- COFACTOR: Pyruvoyl group (By similarity).
-!- COFACTOR: Pyruvoyl group (By similarity).
-!- SIMILARITY: Belongs to the phosphatidylserine decarboxylase
family. Subfamily 2.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   HAMAP, MF 00663; -; 1.

Subarited (JAN-1998) to the EMBL/GenBank/DDBJ databases.
Subarited (JAN-1998) to the EMBL/GenBank/DDBJ databases.
-!- FUNCTION: Hydrolyzes diadenosine 5',5'''-Pl,P4-tetraphosphate to
yield ADP (By similarity)
-!- CATALWITC ACTIVITY: P(1),P(4)-bis(5'-adenosyl)tetraphosphate +
H(2)0 = 2 ADP.
-!- SIMILARITY: Belongs to the Ap4A hydrolase family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

Setubal J.C., Kitajima J.P.;
"Comparison of the genomes of two Xanthomonas pathogens with differing host specificities.";
Nature 417.459-463(2002).
-!-FUNCTION: The sigma factor is an initiation factor that promotes attachment of the RNA polymerase to specific initiation sites and then is released. This is the primary sigma-factor of this bacteria (By similarity).
-!-SIMILARITY: Belongs to the sigma-70 factor family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          MEDILINE=97257506; PubMed=9103980; Salvini M., Bini E., Santucci A., Batistoni R.,; Mistone in the macronucleus of Blepharisma japonicum (Protozoa, Ciliophora, Heterorichida) "; FEMS Microbiol. Lett. 149:93-98(1997).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Pfam; PF03979; sigma70_r1_i; 1.

"H4 histone in the macronucleus of Blepharisma japonicum (Protozoa,
Ciliophora, Heterotrichida).",
FEMS Microbiol. Lett. 149:93-98(1997).
-!- FUNCTION: Histone H4, along with histone H3, plays a central role
in nucleosome formation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
-:- SUBUNIT: The nucleosome is an octamer containing two molecules each of H2A, H2B, H3 and H4. The octamer wraps approximately 146 bp of DNA.
-:- SIMILARITY: Belongs to the histone H4 family.
                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                -!- SUBUNIT: The nucleosome is an octamer containing two molecules each of H2A, H2B, H3 and H4.                                                                                                                                                                                                                                                                                                                                                                         Genome Res. 13:1572-1579(2003).
-!- FUNCTION: This protein is located at the 30S-50S ribosomal subunit interface and may play a role in the structure and function of the aminoacy1-tRNA binding site (By similarity).
-!- SIMILARITY: Belongs to the L19P family of ribosomal proteins.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                "Comparative complete genome sequence analysis of the amino acid replacements responsible for the thermostability of Corynebacterium efficiens.";

Submitted (MAY-2002) to the EMBL/GenBank/DDBJ databases.
-!- FUNCTION: This protein is located at the 305-50S ribosomal subunit
interface and may play a role in the structure and function of the
aminoacy1-tRNA binding site (By similarity).
-!- SIMILARITY: Belongs to the L19P family of ribosomal proteins.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     0; Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Arabidopsis thaliana (Mouse-ear cress).

"Empirical analysis of transcriptional activity in the Arabidopsis
                                                                                                 phosphate.
-!- COFACTOR: Binds 2 magnesium or manganese ions (By similarity).
-!- SIMILARITY: Belongs to the PP2C family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Homo sapiens (Human).
Eukaryota, Metazoa, Chordata, Craniata, Vertebrata, Euteleostomi;
Mammalia: Eutheria, Primates, Catarrhini; Hominidae, Homo.
                                                                -i- FUNCTION: Involved in abscisic acid (ABA) signaling pathway.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ..

Proteins that associate with the core dimer include three families of regulatory subunits B (the RZ/B/RR55/BS5, R3/a'/PR72/PR130/PRS9 and R5/B'/Bs6 families), the 48 kDa variable regulatory subunit, viral proteins, and cell signaling molecules.
-!- SUBCELLULAR LOCATION: Cyroplasmic.
-!- TISSUE SPECIFICITY: Widely expressed with the highest expression in heart and skeletal muscle.

-1- FUNCTION: The signa factor is an initiation factor that promotes attachment of the RNA polymerase to specific initiation sites and then is released. This is the primary signa-factor of this bacteria (By similarity).

-1- SIMILARITY: Belongs to the signa-70 factor family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     PROSITE; PS00715; SIGMA70 1; 1.

-!-CATALYTIC ACTIVITY: ATP + D-hexose = ADP + D-hexose 6-phosphate.
-!-CATALYTIC ACTIVITY: ATP + D-hexose = ADP + D-hexose 6-phosphate.
-!-ENZWHE REGULATION: Hexokinase is an allosteric enzyme inhibited by its product Glc-6-P.
-!-SENDINI: Monomer.
-!-SENDINI: Monomer.
-!-COMAIN: THE N-AND C-TERMINAL HALVES OF THIS HEXOKINASE SHOW EXTENSIVE SEQUENCE SIMILARITY TO EACH OTHER. THE CATALYTIC ACTIVITY IS ASSOCIATED WITH THE N-TERMINUS WHILE REGULATORY FUNCTION IS ASSOCIATED WITH THE N-TERMINUS.
-!-MISCELLANEOUS: In vertebrates there are four major glucose-phosphorylating isoenzymes, designated hexokinase I, II, III and

Treating cardiac diseases, e.g. heart failure or myocardial dysfunction comprises enhancing cardiac contractility by inhibiting interaction between phospholamban and sarcoplasmic reticulum calcium 2+ adenosine triphosphatase.

Example 5; Page 53; 56pp; English.

small peptide complexes may recombine that induces that induces phospholambar (FLB) deficiency and inhibits the interaction between PLB and sarcoplasmic reticulum Ca 2+ ArPase (SERCA2a) within cardiomycytes. The peptide complex comprises of transport peptide like penetratin and cargo peptide selected from mutant PLB, native PLB or antibody against PLB protein (contractilin). Penetratin. PLB peptide functions as a dominant negative inhibitor of PLB-SERCA2a interaction, enhances cardiac contractility and reduces blood pressure. This method is useful for the treatment of cardiac disease e.g. heart failure and myocardial dysfunction. The present sequence is the penetratin-based recombinant peptide TAT-mutant PLB, comprising the amino terminal end of human PLB mutant (Ser31Glu) protein, attached to the 3' end of denatured human immunodeficiency virus (HIV), TAT protein. Penetratin is a class of The patent discloses a method for the treatment of heart failure, using

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to delivering a therapeutic dose of a gene expression cassette in a fluid selectively to heart for sustained expression, comprising employing a viral vector together with a vascular permeabilising agent. The method is useful for gene therapy delivering genes for improving or enhancing cardiac function, particularly in hamster models of heart disease. The present sequence is that of a pseudophosphorylation mutant of phospholamban (SiGEPLB). This point mutant is among a number of dominant negative mutants identified and characterised in WOOO/25804 and used in the method of the present
dominant negative inhibitor of PLB-SERCA2a interaction, enhances cardiac contractility and reduces blood pressure. This method is useful for the treatment of cardiac disease e.g. heart failure and myocardial dysfunction. The present sequence is the penetratin-based recombinate peptide, mutant PLB-ANT, comprising the amino terminal end of human PLB mutant (Ger16Glu) protein, attached to the 5' end of the Drosophila antennapedia (ANT) transport peptide. Penetratin is a class of peptides, with translocating properties having the ability to carry hydrophilic compounds across the plasma membrane
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human; phospholamban; PLB; cardiant; heart disease; gene therapy;

```
cargo peptide selected from mutant PLB, native PLB or antibody against PLB protein (contractions). Penetratin-PLB peptide functions as a dominant negative inhibitor of PLB-SERCACA interaction, enhances cardiac contractility and reduces blood pressure. This method is useful for the treatment of cardiac disease e.g. heart failure and mycocardial dysfunction. The present sequence is the hexahistidine (HB) tagged penetratin-based recombinant protein H6-mutantishidine (HB) tagged human mutant (Sarl6dul) PLB protein and brosophila antennapedia (ANT) transport peptide attached by a hexahistidine tag. This sequence is

Treating cardiac diseases, e.g. heart failure or myocardial dysfunction comprises enhancing cardiac contractility by inhibiting interaction between phospholamban and sarcoplasmic reticulum calcium 2+ adenosine triphosphatase

Example 4; Page 50; 56pp; English.

The patent discloses a method for the treatment of heart failure, using small peptide complexes and recombinant proteins, that induces phospholamban (PLB) deficiency and inhibits the interaction between PLB and sarcoplasmic reticulum (2 + Arbase (SRRCA2a) within cardiomycytes. The peptide complex comprises of transport peptide like penetratin and cargo peptide selected from mutant PLB, native PLB or antibody against PLB protein (contractilin). Penetratin-PLB peptide functions as a dominant negative inhibitor of PLB-SERCA2a interaction, enhances cardiac contractility and reduces blood pressure. This method is useful for the treatment of cardiac disease e.g. heart failure and myocardial dysfunction. The present amino acid sequence is the cargo peptide from

contractility and reduces blood pressure. This method is useful for the treatment of cardiac disease e.g. heart failure and myocardial dysfunction. The present sequence is the penetratin-based recombinant peptide TAT-PLB, comprising the amino terminal end of human PLB native protein, attached to the 3' end of denatured human immunodeficiency virus (HIV), TAT protein. Penetratin is a class of peptides, with translocating properties having the ability to carry hydrophilic compounds across the

The compound has a structure containing three of the four moieties: an electronegative moiety associating with an S1 binding site of the phospholamban cytosolic domain when the compound is bound to it, the binding site comprises Tyr-6, Arg-9 and/or Arg-13; an electronegative moiety associating with an S2 binding site comprises Arg-14, a hydrophobic moiety associating with an S3 binding site comprises Arg-14, a hydrophobic moiety associating with an S3 binding site of the phospholamban cytosolic domain when the compound is bound, the binding not be phospholamban cytosolic domain when the compound is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human, SERCA_2; phospholamban; PLB;
Ca2+ ATPase of the sarco/endoplasmic reticulum; protein co-ordinate data;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New compound, useful for relieving inhibitory effects of phospholamban on cardiac SR Ca2+-ATPase by deactivating phospholamban and stimulating Ca2+
and sarcoplasmic reticulum Ca 2+ AFPase (SERCA2a) within cardiomyocytes. The peptide complex comprises of transport peptide like penetratin and cargo peptide selected from mutant PLB, native PLB or antibody against PLB protein (contractilin). Penetratin-PLB peptide functions as a dominant negative inhibitor of PLB-SERCA2a interaction, enhances cardiac contractility and reduces blood pressure. This method is useful for the treatment of cardiac disease e.g. heart failure and myocardial dysfunction. The present sequence is the penetratin-based recombinant epptide PLB-ANT, comprising the amino terminal end of human PLB native protein, attached to the 5, end of the Drosophila antennapedia (ANT) transport peptide. Penetratin is a class of peptides, with translocating properties, having the ability to carry hydrophilic compounds across the
                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                            ö,

site comprises Met-20, Lys-27 and/or Leu-28, and a hydrophobic moiety associating with an S4 binding site of the phospholamban cytosolic domain when the compound is bound, the binding site comprises Phe-32 and/or Phe-35. The compound is not 3-benzoly. 5,7-bis ((IH-tetrazol-5-yl)-methyloxy)-4-methyl-2H-methyl-2H-1-benzopyzan-2-one. Also included are deactivating phospholamban, comprising administering the novel compound to stimulate the Ca 2 + -ATPase. The compound is useful for reliaving the inhibitory effects of phospholamban on cardiac SERCA_2. The present sequence is the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Phospholamban, PLB, human, sarcoplasmic reticulum Ca 2+ ATPase, SERCA2a, cardiant, cardiomyocyte; transport peptide; penetratin, cargo peptide; contractilin; cardiac contractility; inhibitor; cardiac disease; treatment; heart failure; myocardial dysfunction; mutent.

```

```
dominant negative inhibitor of PIB-SERCA2a interaction, enhances cardiac contractility and reduces blood pressure. This method is useful for the treatment of cardiac disease e.g. heart failure and myocardial dysfunction. The present amino acid sequence is the human mutant PIB protein, comprising the mutation Serieban. This mutant sequence when overexpressed in the transformed cardiomyocytes, shows increased contractility than the wild type PIB sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The patent discloses a method for the treatment of heart failure, using small peptide complexes and recombinant proteins, that induces phospholamban (PLB) deficiency and inhibits the interaction between PLB and sarcoplasmic reticulum Ca 2+ ATPase (SERCA2a) within cardiomycoytes. The peptide complex comprises of transport peptide like penetratin and cargo peptide selected from mutant PLB, native PLB or antibody against PLB protein (contractilin). Penetratin-PLB peptide functions as a dominant negative inhibitor of PLB-SERCA2a interaction, enhances cardiac contractility and reduces blood pressure. This method is useful for the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Phospholamban, PLB; human; sarcoplasmic reticulum Ca 2+ ATPase; SERCA2a, carddant; carddomyocytre; transport peptide; penetratin, cargo peptide; contractilin; cardiac contractility; inhibitor; cardiac disease; treatment; heart failure; myocardial dysfunction; mutant.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Treating cardiac diseases, e.g. heart failure or myocardial dysfunction comprises enhancing cardiac contractility by inhibiting interaction between phospholamban and sarcoplasmic reticulum calcium 2+ adenosine

The patent discloses a method for the treatment of heart failure, using small peptide complexes and recombinant proteins, that induces phospholamban (plB) deficiency and inhibits the interaction between PlB and sarcoplasmic reticulum Ca 2+ ATPase (SERCA2s) within cardiomycoytes. The peptide complex comprises of transport peptide like penetratin and cargo peptide selected from mutant PlB, native PlB or antibody against PLB protein (contractilin). Penetratin-PLB peptide functions as a

Treating cardiac diseases, e.g. heart failure or myocardial dysfunction comprises enhancing cardiac contractility by inhibiting Interaction between phospholamban and sarcoplasmic reticulum calcium 2+ adenosine

treatment of cardiac disease e.g. heart failure and myocardial dysfunction. The present amino acid sequence is the human mutant PLB protein, comprising a sense mutation Val49Ala. This mutant sequence when overexpressed in the transformed cardiomyocytes, shows increased contractility than the wild type PLB sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Phospholamban; PLB; human; sarcoplasmic reticulum Ca 2+ ATPase; SERCA2a; cardiant, cardiamyocyte; transport peptide; penetratin; cargo peptide; contractilin; cardiac contractility; inhibitor; cardiac disease; treatment; heart failure; myocardial dysfunction,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              /note= "Transmembrane sector made of uncharged residues responsible for stabilising the pentamer formation"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Treating cardiac diseases, e.g. heart failure or myocardial dysfunction comprises enhancing cardiac contractility by inhibiting interaction between phospholamban and sarcoplasmic reticulum calcium 2+ adenosine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The patent discloses a method for the treatment of heart failure, using small peptide complexes and recombinant proteins, that induces phospholamban (PLB) deficiency and inhibits the interaction between PLB

ö
and sarcoplasmic reticulum Ca 2+ ATPase (SERCA2a) within cardiomyocytes. The peptide complex comprises of transport peptide like penetratin and cargo peptide selected from mutant PiB, native PiB or antibody against PiB protein (contractilin). Penetratin-PiB peptide functions as a dominant negative inhibitor of PiB-SERCA2a interaction, enhances cardiac contractility and reduces blood pressure. This method is useful for the treatment of cardiac disease e.g. heart failure and myccardial dysfunction. The present amino acid sequence is the human PiB wild type protein, a potent inhibitor of SERCA2a activity. It primarily exists in a pentaneric form. It is a mediator in the regulation of myocardial function by catecholamines through the cAMP cascade
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention describes substantially purified human proteins treferred to as open reading frame, ORFX, where X is 1-11491 (see Table 1 in the specification). ARNISTS2 and ARNISTS2 encode the human ORFX proteins given in ABP00010 to ABP11500. ORFX proteins are useful for treating or preventing a pathology associated with an ORFX-associated disorder in humans, and in the manifacture of a medicament for treating syndrome associated with ORFX-associated disorder. New compound, useful for relieving inhibitory effects of phospholamban on cardiac SR Ca2+-ATPase by deactivating phospholamban and stimulating Ca2+ ATPase.

Claim 1; SEQ ID NO 6; 65pp; English.

The invention relates to a compound which deactivates, and exhibits affinity for, a phospholamban (FIB) protein (an inhibitor of SRCA\_2, Ca2+ AIPase of the sarco/endoplesmic reticulum ) appearing as ADB45167-ADB45173. The compound has a structure containing three of the four moleties: an electronegative molety associating with an SI binding site of the phospholamban cytosolic domain when the compound is bound to it, the binding site comprises Tyr-6, Arg-9 and/or Arg-13; an electronegative 

moiety associating with an S2 binding site of the phospholamban cytosolic domain when the compound is bound to it, the S2 binding site comprises Arg-14; a hydrophobic moiety associating with an S3 binding site of the phospholamban cytosolic domain when the compound is bound, the binding site comprises Met-20, Lys-27 and/or Leu-28; and a hydrophobic moiety associating with an S4 binding site of the phospholamban cytosolic domain when the compound is bound, the binding site of the phospholamban cytosolic domain when the compound is not 3-berzyl-5,7-bis ([HH-tetrazol-5-y1)-methyloxy)-4-methyl-2H-methyl-2H-l-benzopyran-2-one. Also included are deactivating phospholamban, comprising administering the novel compound to stimulate the Ca. 2 + -ATPase. The compound is useful for relieving the inhibitory effects of phospholamban on cardiac SERCA\_2. The present sequence is a phospholamban. 88888888888888888

New compound, useful for relieving inhibitory effects of phospholamban on cardiac SR Ca2+-ATPase by deactivating phospholamban and stimulating Ca2+ -ATPase.

Claim 1; SEQ ID NO 4; 65pp; English.

The invention relates to a compound which deactivates, and exhibits affinity for, a phospholamban (PLB) protein (an inhibitor of SERCA 2, Ca2+ Arpense of the sarco/endoplasmic reticulum) appearing as ADE45167-ADE45173. The compound has a structure containing three of the four moieties: an electronegative moiety associating with an S1 binding site of the phospholamban cytosolic domain when the compound is bound to it, the binding site comprises Tyr-6, Arg-9 and/or Arg-13; an electronegative moiety associating with an S2 binding site comprises Tyr-6, Arg-9 and/or Arg-13; an electronegative moiety associating with an S2 binding site comprises Arg-14; a hydrophobic moiety associating with an S3 binding site comprises Arg-14; a hydrophobic moiety associating with an S3 binding site of the phospholamban cytosolic domain when the compound is bound, the binding

The invention relates to a compound which deactivates, and exhibits affinity for, a phospholamban (PLB) protein (an inhibitor of SERCA, 2, Ca2+ ArPase of the sarco/endoplasmic reticulum, appearing as ADB45167-ADB45167-ADB45167-ADB45167-ADB45167-ADB45167-ADB45167-ADB45167-ADB45167-ADB45167-ADB45167-ADB45167-ADB45167-ADB45167-ADB45167-ADB45167-ADB45167-ADB45167-ADB45167-ADB45167-ADB45167-ADB45167-ADB45167-ADB45167-ADB45167-ADB45167-ADB45167-ADB45167-ADB45167-ADB45167-ADB45167-ADB45167-ADB45167-ADB45167-ADB45167-ADB45167-ADB45167-ADB45167-ADB45167-ADB45167-ADB45167-ADB45167-ADB45167-ADB45167-ADB45167-ADB45167-ADB45167-ADB45167-ADB5167-ADB5167-ADB5167-ADB5167-ADB5167-ADB5167-ADB5167-ADB5167-ADB5167-ADB5167-ADB5167-ADB5167-ADB5167-ADB5167-ADB5167-ADB5167-ADB5167-ADB5167-ADB5167-ADB5167-ADB5167-ADB5167-ADB5167-ADB5167-ADB5167-ADB5167-ADB5167-ADB5167-ADB5167-ADB5167-ADB5167-ADB5167-ADB5167-ADB5167-ADB5167-ADB5167-ADB5167-ADB5167-ADB5167-ADB5167-ADB5167-ADB5167-ADB5167-ADB5167-ADB5167-ADB5167-ADB5167-ADB5167-ADB5167-ADB5167-ADB5167-ADB5167-ADB5167-ADB5167-ADB5167-ADB5167-ADB5167-ADB5167-ADB5167-ADB5167-ADB5167-ADB5167-ADB5167-ADB5167-ADB5167-ADB5167-ADB5167-ADB5167-ADB5167-ADB5167-ADB5167-ADB5167-ADB5167-ADB5167-ADB5167-ADB5167-ADB5167-ADB5167-ADB5167-ADB5167-ADB5167-ADB5167-ADB5167-ADB5167-ADB5167-ADB5167-ADB5167-ADB5167-ADB5167-ADB5167-ADB5167-ADB5167-ADB5167-ADB5167-ADB5167-ADB5167-ADB5167-ADB5167-ADB5167-ADB5167-ADB5167-ADB5167-ADB5167-ADB5167-ADB5167-ADB5167-ADB5167-ADB5167-ADB5167-ADB5167-ADB5167-ADB5167-ADB5167-ADB5167-ADB5167-ADB5167-ADB5167-ADB5167-ADB5167-ADB5167-ADB5167-ADB5167-ADB5167-ADB5167-ADB5167-ADB5167-ADB5167-ADB5167-ADB5167-ADB5167-ADB5167-ADB5167-ADB5167-ADB5167-ADB5167-ADB5167-ADB5167-ADB5167-ADB5167-ADB5167-ADB5167-ADB5167-ADB5167-ADB5167-ADB5167-ADB5167-ADB5167-ADB5167-ADB5167-ADB5167-ADB5167-ADB5167-ADB5167-ADB5167-ADB5167-ADB5167-ADB5167-ADB5167-ADB5167-ADB5167-ADB5167-ADB5167-ADB5167-ADB5167-ADB5167-ADB5167-ADB5167-ADB5167-ADB5167-ADB5167-ADB5167-ADB5167-ADB5167-ADB5167-ADB5167-ADB5167-ADB516
site comprises Met-20, Lys-27 and/or Leu-28, and a hydrophobic moiety associating with an S4 binding site of the phospholamban cycosolic domain when the compound is bound, the binding site comprises Phe-32 and/or Phe-35. The compound is not 3-benzyl-5,7-bis ((IH-tetrazol-5-yl)-methyloxy)-4-methyl-2H-methyl-2H-benzopyran-2-one. Also included are deactivating thospholamban, comprising administering the novel compound to stimulate the Ca 2 + -ATPase. The compound is useful for relieving the inhibitory effects of phospholamban on cardiac SERCA_2. The present sequence is a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Rat; SERCA 2; phospholamban; PLB;

The invention relates to a compound which deactivates, and exhibits affinity for, a phospholamban (PLB) protein (an inhibitor of SERCA 2, 224. ATPBase of the sarco/endoplasmic reliculum ) appearing as ADB45167-ADB4513. The compound has a structure containing three of the four moiettes: an electronegative moiety associating with an S1 binding site of the phospholamban cytosolic domain when the compound is bound to it, the binding site comprises Tyr-6, Arg-9 and/or Arg-13; an electronegative moiety associating with an S2 binding site of the phospholamban cytosolic domain when the compound is bound to it, the S2 binding site of the phospholamban cytosolic domain when the compound is bound, the binding site of the phospholamban cytosolic domain when the compound is bound, the binding site of the phospholamban cytosolic domain when the compound is bound, the binding site of the phospholamban cytosolic domain when the compound is bound, the binding site of the phospholamban cytosolic domain the compound is bound, the binding site of the phospholamban cytosolic domain when the compound is bound, the binding site of the phospholamban cytosolic domain when the compound is not 3-benzyl-5,7-bis ((IH-tetrazol-5-yl)-methyloxy)-4-methyl-2H-methyl-2H-methyl-2H-methyl-2H-methyl-2H-methyloxyl-4-methyl-2H-methyl-2H-methyl-2H-methyloxyl-4-methyl-2H-methyl-2H-methyl-2H-methyl-2H-methyl-2H-methyl-2H-methyl-2H-methyl-2H-methyl-2H-methyl-2H-methyl-2H-methyl-2H-methyl-2H-methyl-2H-methyl-2H-methyl-2H-methyl-2H-methyl-2H-methyl-2H-methyl-2H-methyl-2H-methyl-2H-methyl-2H-methyl-2H-methyl-2H-methyl-2H-methyl-2H-methyl-2H-methyl-2H-methyl-2H-methyl-2H-methyl-2H-methyl-2H-methyl-2H-methyl-2H-methyl-2H-methyl-2H-methyl-2H-methyl-2H-methyl-2H-methyl-2H-methyl-2H-methyl-2H-methyl-2H-methyl-2H-methyl-2H-methyl-2H-methyl-2H-methyl-2H-methyl-2H-methyl-2H-methyl-2H-methyl-2H-methyl-2H-methyl-2H-methyl-2H-methyl-2H-methyl-2H-methyl-2H-methyl-2H-methyl-2H-methyl-2H-methyl-2H-methyl-2H-methyl-2H-methyl-2H-methyl-2H-methyl-2H-methyl-2H-methyl-2H-meth
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Phospholamban, PLB; human, sarcoplasmic reticulum Ca 2+ ATPase, SERCA2a, cardiant, cardiomycorpe, transport peptide, penetratin, cargo peptide, contractilin, cardiac contractility; inhibitor; cardiac disease; mutant, treatment; heart fallure; myccardial dysfunction; recombinant protein; fruit fly; ANT; antennapedia; H6 tag; hexahistidine.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    H6 tagged penetratin-based recombinant protein, H6-(V49A) mutantPLB-ANT.

The patent discloses a method for the treatment of heart failure, using small peptide complexes and recombinant proteins, that induces phospholamban (PLB) deficiency and inhibits the interaction between PLB can discretion between PLB and sarcoplasmic reticultum Ca 2+ ATPaca (SERCAZA) within cardiomycytes. The peptide complex comprises of transport peptide like penetratin and cargo peptide selected from mutant PLB, native PLB or antibody against CPLB protein (contractilin). Penetratin-PLB peptide functions as a dominant negative inhibitor of PLB-SERCAZA interaction, enhances cardiac contractility and reduces blood pressure. This method is useful for the treatment of cardiac disease e.g. heart failure and myocardial dysfunction. The present sequence is the hexahistidine (H6) tagged penetratin-based recombinant protein H6-mutantPLB-ANT, comprising the human mutant (Val49Ala) PLB protein and brosophila antennapedia (ANT) transport peptide attached by a hexahistidine tag. This sequence is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  "Corresponds to Human phospholamban (PLB) protein"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Phospholamban; PLB; human; sarcoplasmic reticulum Ca 2+ ATPase; SERCA2a; cardiant; cardiomyocyte; transport peptide; penetratin; cargo peptide; contractilin; cardiac contractility; inhibitor; cardiac disease; treatment; heart failure; myocardial dysfunction; recombinant protein; fruit fly; ANT; antennapedia; H6 tag; hexahistidine.
                                                                                                                                     Treating cardiac diseases, e.g. heart failure or myocardial dysfunction comprises enhancing cardiac contractility by inhibiting interaction between phospholamban and sarcoplasmic reticulum calcium 2+ adenosine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Hexahistidine tagged penetratin-based recombinant protein, H6-wtPLB-ANT.

                                                                                                                                                                                                                           The patent discloses a method for the treatment of heart failure, using small peptide complexes and recombinant proteins, that induces phospholamban (PLB) deficiency and inhibits the interaction between PLB and sarcoplasmic reticulum Ca 2+ ATPase (SERCA2a) within cardiomycoytes. The peptide complex comprises of transport peptide like penetratin and cargo peptide selected from mutant PLB, native PLB or antibody against PLB protein (contractilin). Penetratin-PLB peptide functions as a dominant negative inhibitor of PLB-SERCA2a interaction, enhances cardiac contractility and reduces blood pressure. This method is useful for the treatment of cardiac disease e.g. heart failure and myocardial dysfunction. The present sequence is the hexahistidine (H6) tagged pentratin-based recombinant protein H6-wtPLB-ANT, comprising the wild type human PLB protein and Drosophila antennapedia (ANT) transport peptide attached by a hexahistidine tag. This sequence is expressed in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Pig; SERCA_2; phospholamban; PLB;

The invention relates to a compound which deactivates, and exhibits affinity for, a phospholamban (PLB) protein (an imhibitor of SERCA 2, Ca2+ ATPase of the sarco/endoplasmic reticulum ) appearing as ADB45167-ADE45173. The compound has a structure containing three of the four moieties: an electronegative moiety associating with an S1 binding site of the phospholamban cytosolic domain when the compound is bound to it, the binding site comprises Tyre, Arg-9 and/or Arg-13; an electronegative moiety associating with an S2 binding site of the phospholamban cytosolic domain when the compound is bound, the S2 binding site of the phospholamen cytosolic domain when the compound is bound, the binding site of the phospholamban cytosolic domain when the compound is bound, the binding site of the phospholamban cytosolic domain when the compound is bound, the binding site of the phospholamban cytosolic domain when the compound is bound, the binding site of the phospholamban cytosolic domain when the compound is bound, the binding site of the phospholamban cytosolic domain when the compound is bound, the binding site of the phospholamban comprises the compound is not 3-benzyl-5/-bis ([1H-tetrazol-5-yl])-methyloxyl-4-methyl-2H-methyl-2H-methyl-2H-benzopyran-2-one. Also included are deactivating the case of the case of phospholamban on cardiac SERCA_2. The present sequence is a
                                                                                                                                                                                  New compound, useful for relieving inhibitory effects of phospholamban on cardiac SR Ca2+-ATPase by deactivating phospholamban and stimulating Ca2+
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Dog; SERCA_2; phospholamban; PLB;

The invention relates to a compound which deactivates, and exhibits affinity for, a phospholamban (PLB) protein (an inhibitor of SERCA 2, 22.4 ATPase of the sarco/endoplasmic reticulum of appearing as ADE45167-ADE4513. The compound has a structure containing three of the four moiettes: an electromegative moiety associating with an SI binding site of the phospholamban cytosolic domain when the compound is bound to it, the binding site comprises Tyr-6, Azg-9 and/or Arg-13; an electromegative moiety associating with an S2 binding site of the phospholamban cytosolic domain when the compound is bound, the S2 binding site of the phospholamban cytosolic comain when the compound is bound, the binding site of the phospholamban cytosolic domain when the compound is bound, the binding site of the phospholamban cytosolic domain when the compound is bound, the binding site of the phospholamban cytosolic domain the compound is bound, the binding site comprises Met-20, Lys-27 and/or Leu-28; and a hydrophobic moiety associating with an S4 binding site of the phospholamban cytosolic domain the compound is bound, the binding site comprises Phospholamban, comprised the binding site comprises Phospholamban comprised the compound is not 3-benzyl-57-bis ((1H-tetrazol-5-4)) methyloxyl-4 methyl-2H-methyl-2H-methyl-2H-lenzopyzan-2-one. Also included are deactivating the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case o
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Phospholamban; PLB; human; sarcoplasmic reticulum Ca 2+ ATPase; SERCA2a; cardiant; cardiomyocyte; transport peptide; penetratin; cargo peptide; contractilin; cardiac contractility; inhibitor; cardiac disease; treatment; heart failure; myocardial dysfunction; mutant.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 88.2%; Score 67; DB 8; Length 52; 86.7%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to a compound which deactivates, and exhibits affinity for, a phospholamban (PLB) protein (an inhibitor of SERCA 2, CA2+ ArPase of the sarco/endoplasmic reticulum) appearing as ADEA5167-ADEA513. The compound has a structure containing three of the four moieties: an electromegative moiety associating with an S1 binding site of the phospholamban cytosolic domain when the compound is bound to it, the binding site comprises Tyre, AST9-Band/or ART9-13; an electromegative moiety associating with an S2 binding site of the phospholamban cytosolic domain when the compound is bound to it, the S2 binding site of the phospholamban cytosolic domain when the compound is bound, the binding site of the phospholamban cytosolic domain when the compound is bound, the binding site of the phospholamban cytosolic domain when the compound is bound, the binding site comprises Phe-32 and/or Phe-35 The compound is not 3-benzyles. Fig. (IH-tetrace)—stylentyle. The compound is not 3-benzyles. Fig. (IH-tetrace)—stylentyle. The compound is not 3-benzyles. Fig. (IH-tetrace)—stylentyle. The compound is comprised and any solution and phospholamban, comprising administering the novel compound to stimulate the CA2 + -APPase. The compound is useful for relieving the inhibitory effects of phospholamban on cardiac SERCA-2. The present sequence is a phospholamban.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                          New compound, useful for relieving inhibitory effects of phospholamban on cardiac SR Ca2+-ATPase by deactivating phospholamban and stimulating Ca2+
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Chicken; SERCA_2; phospholamban; PLB;

The patent discloses a method for the treatment of heart failure, using small peptide complexes and recombinant proteins, that induces phospholamban (PLB) deficiency and inhibits the interaction between PLB and sarcoplasmic reticulum C2 + Arpase (SERCA2a) within cardiomycorptes. The peptide complex comprises of transport peptide like penetrain and cargo peptide complex comprises of transport peptide like penetrain and PLB protein (contractilin). Penetratin-PLB peptide functions as a dominant negative inhibitor of PLB-SERCA2a interaction, enhances cardiac contractility and reduces blood pressure. This method is useful for the treatment of cardiac disease e.g. heart failure and myocardial dysfunction. The present amino acid sequence is the human mutant PLB protein, comprising a sense mutation Argidulus, shows increased contractility than the wild type PLB sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Phospholamban; PLB; human; sarcoplasmic reticulum Ca 2+ ATPase; SERCA2a; cardiant; cardianycoyte; transport peptide; penetratin; cargo peptide; contractilin; cardiac contractility; inhibitor; cardiac disease; treatment; heart failure; myocardial dysfunction; mutant.
               Treating cardiac diseases, e.g. heart failure or myocardial dysfunction comprises enhancing cardiac contractility by inhibiting interaction between phospholamban and sarcoplasmic reticulum calcium 2+ adenosine
                                                                                                                                                                                                                                                                                                                                                                                                                                           Length 52;

small peptide complexes and recombinant proteins, that induces phospholamban (PLB) deficiency and inhibits the interaction between PLB and sarcoplasmic reticulum Ca 2+ Aprase (SERCA2a) within cardiomycoytes. The peptide complex comprises of transport peptide like penetratin and cargo peptide selected from mutant PLB, native PLB or antibody against pLB protein (contractilli). Penetratin-PLB peptide functions as a dominant negative inhibitor of PLB-SERCA2a interaction, enhances cardiac contractility and reduces blood pressure. This method is useful for the treatment of cardiac disease e.g. heart failure and myccardial dysfunction. The present amino acid sequence is the human mutant PLB protein, comprising the mutantion Glu2Ala. This mutant sequence when overexpressed in the transformed cardiomycoytes, shows increased
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Phospholamban; PLB; human; sarcoplasmic reticulum Ca 2+ ATPase; SERCA2a; cardiant; cardiomyocyte; transport peptide; penetratin; cargo peptide; contractilin; cardiac contractility; inhibitor; cardiac disease; treatment; heart failure; myocardial dysfunction; mutent.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Treating cardiac diseases, e.g. heart failure or myocardial dysfunction
                                                                                                     patent discloses a method for the treatment of heart failure, using
comprises enhancing cardiac contractility by inhibiting interaction between phospholamban and sarcoplasmic reticulum calcium 2+ adenosine
                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

comprises enhancing cardiac contractility by inhibiting interaction between phospholamban and sarcoplasmic reticulum calcium 2+ adenosine triphosphatase.
```

Disclosure; Page 49; 56pp; English.

small peptide complexes and recombinant proteins, that induces phospholamban (PLB) deficiency and inhibits the interaction between PLB and sarcoplasmic reticulum Ca 2+ ATPase (SRCA2a) within cardiomycytes. The peptide complex comprises of transport peptide like penetratin and cargo peptide selected from mutant PLB, native PLB or antibody against PLB protein (contractilin). Penetratin-PLB peptide functions as a dominant negative inhibitor of PLB-SERCA2a interaction, enhances cardiac contractility and reduces blood pressure. This method is useful for the treament of cardiac disease e.g. heart failure and myccardial dysfunction. The present amino acid sequence is the human mutant PLB protein, comprising the double mutation lyssquance when overexpressed in the transformed cardiomycottes, shows increased contractility than the wild type PLB sequence The patent discloses a method for the treatment of heart failure, using

Patent NO. 6551795
GENERAL INFORMATION:
APPLICANT: Marc J. Rubenfield et al.
APPLICANT: Marc J. Rubenfield et al.
TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO PSEUDOMONAS
TITLE OF INVENTION: AERUGINOSA FOR DIAGNOSTICS AND THERAPEUTICS
FILES REPRENCE: 107196-136
CURRENT APPLICATION NUMBER: US/09/252,991A
CURRENT FILING DATE: 1998-02-18
PRIOR APPLICATION NUMBER: US 60/074,788
PRIOR APPLICATION NUMBER: US 60/094,190
PRIOR FILING DATE: 1998-07-27
NUMBER OF SEQ ID NOS: 33142
SEQ ID NO 28362
LENGTH: 210
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       1; Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   52.0%; Score 39.5; DB 2; Length 835; 66.7%; Pred.
